

innovaphone Mobile Integration and innovaphone GSM Client

Mobile Integration – Integrating mobile phones in to the innovaphone PBX

The innovaphone PBX Version 8 has an optional mobility module which enables easy integration of mobile phones into the telephone system. Mobile telephones thus become PBX subscribers, able to benefit from the telephone system features. CTI software also recognises the mobile phone as an internal subscriber.

The fixed network is always used for mobile calls when mobile phones are integrated into the innovaphone PBX. This in turn improves cost control for communication costs.

A separate server is not necessary as the V8 Mobility solution is fully integrated into the innovaphone PBX.

The mobility function allows mobile telephones to be integrated as full subscribers in the telephone system, and the GSM client displays the innovaphone PBX functions on the mobile phone, thus providing the user with comfortable user guidance for many PBX features. The innovaphone GSM client enables simple dialling out of the mobile phone address book and ensures that all calls are directed by default over the innovaphone PBX.

The innovaphone GSM Client

Our own GSM client is available in order to turn the mobile phone into a full innovaphone PBX extension. All that is needed is a mobile phone with the innovaphone GSM client and of course an innovaphone PBX. An extra server is not necessary.

The client enables mobile phones to automatically use the PBX for calls made in and out of the system (2 stage dialling). It is possible for example, to use the GSM client to dial internal and external numbers from the mobile phone address book.

One Number Solution: One number for fixed line telephones and mobile telephones

The PBX shows the mobile telephone and the fixed line telephone as one extension. If a subscriber is called on his com-

pany extension number, then both his fixed line telephone and his mobile telephone will ring (Twin Phone function). The company extension number is displayed when the user makes external calls (One Number Solution).

innovaphone PBX features which are supported using a mobile phone (examples):

- Transfer
- Switch/hold
- Call Pickup
- Call Waiting
- Ringing off or holding active calls
- Picking up calls on hold or a further phone call
- Defining own presence status
- Log in and out of groups
- Set or delete own call forward
- Search & dial from address book
- One voice mail box for fixed line and mobile telephones

The innovaphone GSM client only works together with the innovaphone PBX. The client versions supporting iPhone and Blackberry are currently being developed. By the way: the mobile phone can of course be switched back to "normal operation" as the GSM client supports several profiles. For example, the mobile phone number could be sent for private calls.

innovaphone Mobile Integration and innovaphone GSM Client

Licenses for Mobility and GSM Client

The Mobility license enables mobile phone subscribers to be activated on the innovaphone PBX (from Version 8). The GSM license includes the client for the relevant mobile telephone manufacturer's operating system. The client only works when both the mobility license and the GSM license have been uploaded to the innovaphone PBX – roll-out on to mobile phones is then really simple.
