

# Highlights of the innovaphone PBX

The innovaphone PBX is a powerful and sophisticated VoIP telephone system for use in professional business environments. In addition to a wide range of IP telephony functionalities, the innovaphone PBX is also equipped with a perfectly integrated Unified Communications solution that can be enabled as needed at any time and at any workspace. A server is superfluous. The innovaphone PBX works on diverse innovaphone VoIP gateways, which are available in different dimensions. Alternatively, it is also possible to move away from hardware entirely and to install the innovaphone PBX virtually as an innovaphone Virtual Appliance (IPVA) in a VMware environment.

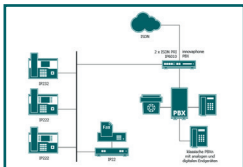

## Everything in one box.

- The VoIP gateways provide the basis for the entire innovaphone PBX
- On one hand they provide the existing ISDN or analogue ports for the entire network
- On the other hand they contain the PBX software and the Unified Communications solution that can be enabled at any time by licenses

## Scalability – innovaphone solutions adapt continuously.

- Any amount of basic innovaphone PBX equipment can be combined
- The innovaphone PBX grows flexibly with the company and never comes close to capacity limits
- Due to the fact that the software runs on the smallest hardware components, the innovaphone PBX is infinitely scalable and can be extended at will

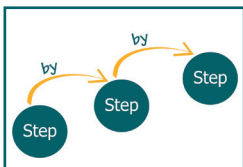

## Teamwork made easy.

- Employees who are separated geographically grow closer together thanks to the IP telephone and Unified Communications solution by innovaphone
- Subscribers throughout the network can make company internal calls, send messages and chat with each other – at no extra cost
- The best means of communication can be selected by using a global Presence system depending on the Presence availability of contacts as indicated

## Security made in Germany.

- innovaphone solutions carry the quality seal „IT Security made in Germany“ and meet strict criteria on IT security and data protection
- The innovaphone redundancy concept increases reliability to a maximum – quickly, automatically and without data loss
- The operating system developed in-house especially runs fully independently and contains all standardized security protocols (SIPS, H.235, SRTP, AES, HTTPS, LDAPS and more)

## Smooth migration.

- „Smooth migration“ makes it possible to enter into VoIP technology gradually
- The existing infrastructure is maintained during the transition
- The customer determines the speed of the migration and investment costs are cut down into small steps

## All IP – Well equipped with innovaphone.

- With innovaphone you are ideally prepared for the process of unifying the transmission technologies
- Smooth migration allows a gradual entry into the IP world, in several stages of innovation
- The customer determines the speed of transition
